FAO Headquarters, Rome

Governance Features for Successful REDD+ Projects Organization

Lucio Brotto and Davide Pettenella
Dept. of Land and Agro-forestry Systems
University of Padova, Italy

Outline

1. Background: REDD+ and project level governance
2. Problem statement
3. Research objective
4. Methodology
5. Results
6. Final remarks: further steps needed?

Background (1/3)

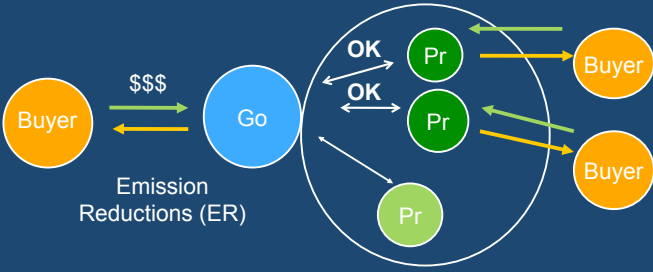

Short term growing importance of REDD+ projects developed at sub-national level

Institutional market:
COP-15 postponement of binding decisions BUT future possibility of applying the "hybrid - nested" approach.

Voluntary market :
projects are already seeing the end of the pipeline.
Q/A & Q/C to be improved.

(UNFCCC, 2009 ; Pedroni *et al.*, 2008; Hamilton *et al.*, 2010)

Hybrid "nested" approach

Buyer → \$\$\$ → Go (Emission Reductions) → OK → Pr (Projects) → Buyer

- flexibility
- experience and data sharing
- scaling up

- MRV harmonization
- Intellectual property rights
- time frame

Background (2/3)

In the voluntary market REDD+ have still a marginal share due to critical organizational aspects related to governance (stakeholders' participation, carbon credits, transparency and accountability in the decision-making process, etc.)

(Hamilton *et al.*, 2007, 2008, 2009 and 2010; Ciccicarese and Piotto, 2009)

Background (3/3)

- A “good governance” system is an essential element for the successful implementation of REDD+;
- There are several sets of forestry and REDD+ governance indicators applicable at international or national level (e.g UN REDD, CCB & CARE, etc.);
- What if indicators are narrowed down to the sub-national level?

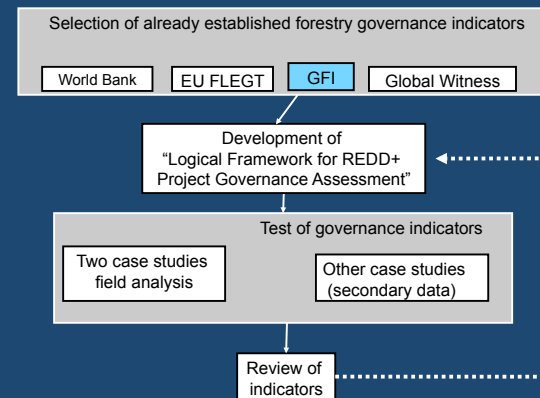

(Kjær, 2004; Saunders and Reeve, 2010; Forsyth, 2009; Saunders *et al.*, 2008)

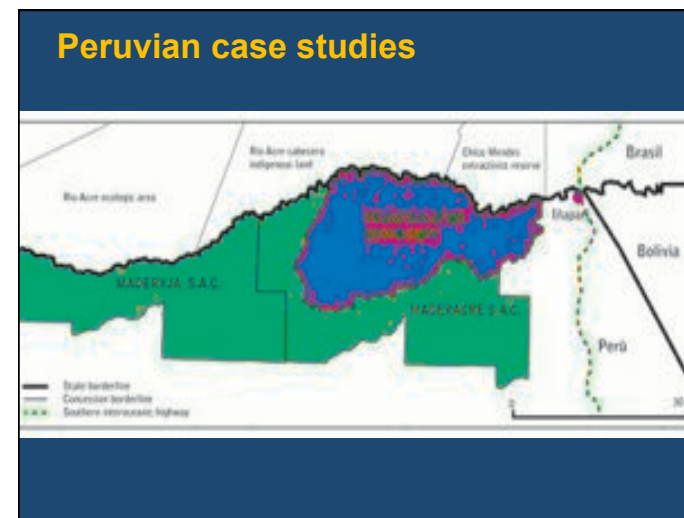

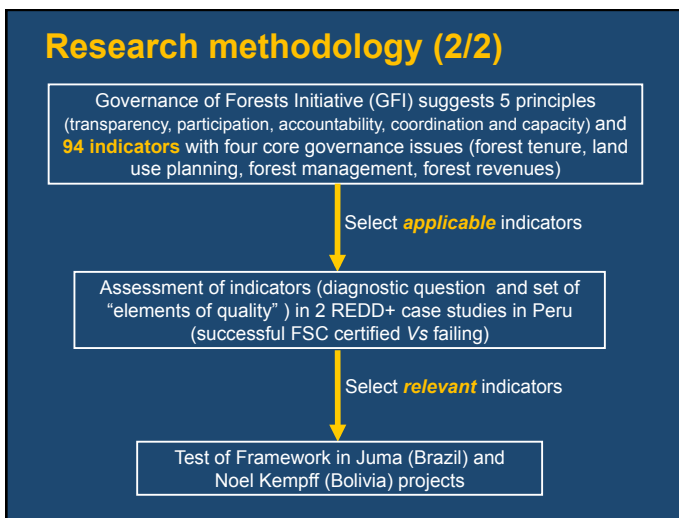

Research Objectives

- Proposing a first draft of logical framework to analyze the governance features for successful REDD+ projects in the (voluntary) carbon market;
- Tuning and improving the logical framework through the analysis of REDD+ projects.

What are the governance features that determine the success of a REDD+ project?

Research methodology (1/2)

Example of identification of relevant governance indicators

| Core Forestry Issues | Indicator | REDD+ Project Score | | Relevant | Relevance value |
|---|--|---------------------|-------------------|----------|-----------------|
| | | M&M (successful) | Belgica (failing) | | |
| Forest Tenure | Capacity to negotiate and design forest contracts | 4 | 4 | NO | 0 |
| Land Use Planning | Access to relevant information for land use planning | 3 | 5 | NO | 0 |
| Forest Management | Local community participation in forest management | 5 | 3 | YES | 1 |
| Forest Revenues and Economic Incentives | Transparent forest revenue sharing mechanisms | 3 | 2 | NO | 0 |

Source: adapted from Brito *et al.* (2009)

| Core Forestry Issues | Indicators |
|---|--|
| Forest Tenure | Capacity to negotiate and design forest contracts |
| | Capacity to resolve forest tenure disputes |
| | Public access to information about forest tenure |
| | Participatory mapping of community forest tenure |
| Land Use Planning | Accessible and effective dispute resolution |
| | Access to relevant information for land use planning |
| | Institutional coordination for land use planning |
| | Representation of grassroots interests and marginalized groups |
| | Transparent process for land use planning |
| | Meaningful public participation in land use planning |
| Forest Management | Quality and accessibility of information about land use plans |
| | Access to information about compliance with the land use plan |
| | Clear process for public participation in policy-making |
| | Meaningful public participation in policy-making |
| | Public access to information about forest management |
| | Local community participation in forest management |
| | Control of forest fires and other disturbances |
| | Effective management of protected areas and indigenous lands |
| | National forest inventories |
| | Monitoring changes in forest cover |
| Independent forest monitoring | |
| Forest Revenues and Economic Incentives | Capacity of civil society organizations to engage on forest revenue issues |
| | Transparent forest revenue sharing mechanisms |
| | Transparent management of extra-budgetary/resource funds |

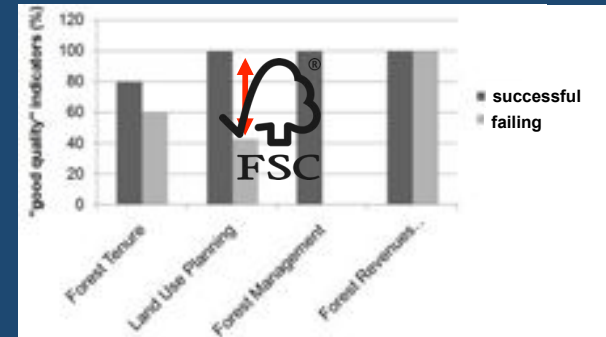

Results (1/3)

Importance of principles of good governance on the total set of 94 GFI indicators, on the 24 applicable indicators and on 14 relevant indicators

Results (2/3)

Percentage of “good quality” governance indicators among the applicable ones in the two case studies by Core Forestry Issues.

Results (3/3)

Tuning and improving the logical framework: test on Juma (Brazil) and Noel Kempff (Bolivia) projects.

Juma: 13 indicators out of 14 (92.8%) are significant.

Noel Kempff: 9 out of 14 (64.3%) are significant.

Constraints in valuing indicators due to the presence of controversial source of information and the absence of dedicated web sites.

Final Remarks (1/2)

- Exploratory research => **refinement needed**;
- **Forest Management** and Land Use Planning are the **most relevant** for REDD + success in Peru;
- **Being certified** (i.e. FSC) allows forest manager to prepare the ground for **successful REDD+ projects**;
- **Transparency** and **accountability** appear to be the **more crucial governance issues** for the success of REDD+ projects in Peru.

Final Remarks (2/2)

- The use of **only secondary data** can lead to **ambiguous results** => quality of the information is essential;

- **More testing**, followed by a calibration of the method, is needed;
- Also with a **bad governance** REDD+ projects can be **delivered to the market**?

Thanks a lot
for the
attention
